

$$G^{1234} = - \left(\text{Diagram 1} + \left(\text{Diagram 2} \right) \times 3 \text{ perms} \right)$$

The equation defines G^{1234} as the negative sum of two diagrams. The first diagram is a central light-gray circle with four blue lines extending from its corners at 45-degree angles. The second diagram, enclosed in large parentheses, shows two such circles connected by a horizontal blue line. The text " $\times 3 \text{ perms}$ " indicates that this second diagram is multiplied by three, representing the sum of its three possible permutations.
