

$$C_{\mu\nu} = -\frac{i}{8} \left(\begin{array}{cc} \text{Clockwise Square} & \text{Counter-clockwise Square} \\ \text{Clockwise Square} & \text{Counter-clockwise Square} \end{array} - \begin{array}{cc} \text{Clockwise Square} & \text{Counter-clockwise Square} \\ \text{Clockwise Square} & \text{Counter-clockwise Square} \end{array} \right)$$

The diagram illustrates the calculation of the coefficient $C_{\mu\nu}$ in terms of fermion loop configurations. The expression is:

$$C_{\mu\nu} = -\frac{i}{8} \left(\begin{array}{cc} \text{Clockwise Square} & \text{Counter-clockwise Square} \\ \text{Clockwise Square} & \text{Counter-clockwise Square} \end{array} - \begin{array}{cc} \text{Clockwise Square} & \text{Counter-clockwise Square} \\ \text{Clockwise Square} & \text{Counter-clockwise Square} \end{array} \right)$$

The first set of four squares (top-left) shows two clockwise and two counter-clockwise loops. The second set of four squares (top-right) shows two clockwise and two counter-clockwise loops. The minus sign indicates a subtraction between the two sets of loops.
